The permanent bed should be made very rich with well-rotted manure. Plant the roots in rows 3 to 4 feet apart, with about 18 inches between the plants in the row. Lay the roots flat in trenches, spreading them well, taking care to have the crown in an upright position. The crowns should be about 6 inches below the level of the bed. Cover lightly at first, gradually filling the trenches as the plants grow.

PEAS

Plant 2 lbs. per 100 feet; about 100 lbs. per acre

Culture—Peas can be planted as early in the Spring as the ground can be worked. Broadcast in furrows 6 to 8 inches wide and 30 inches apart so that 1 lb. will plant 50 feet. Cover seed 1½ to 2 inches deep. Good, rich loam is required for the best success. Apply Land Lime if necessary, as Peas do not thrive on acid soil. Make the first sowing as early as possible and follow up with subsequent plantings to insure a continuous supply throughout the season. For later sowing we recommend the earlier varieties. As Peas are legumes, it is well to inoculate the seed with Nitragin which will result in sturdier growth and greater yield. Garden size package, sufficient to inoculate up to 8 lbs. of seed 15c. Simple and easy to use. Complete directions with every package. Be sure to include one with your order.

Postpaid at packet and pound prices. For larger quantities by Parcel Post, add postage at Zone rates. See inside front cover

PERRY'S SHADY SPOT LAWN SEED

There's no better mixture for sowing on the north side of buildings, between houses or under shade trees receiving sunshine less than half the day

Our **Shady Spot Lawn Seed** is blended from the best grasses possible to obtain for this purpose, only those that grow and flourish under shady conditions in their natural and wild state being used. It is always advisable for those who are seeding down shady places to supply new soil, if possible, especially if large trees are producing the shade, as their roots spread so fast as to quickly exhaust its nourishment. Liberal amounts of fertilizer are as necessary for lawns under shade trees as are plenty of seed and water. Trimming to allow more air and light is frequently helpful.

PERRY'S SEASHORE LAWN GRASS MIXTURE

Many a lawn along the New England Shore has been grown from this mixture

A rich, green lawn is especially appreciated and desirable at the seashore, but usually conditions are decidedly unfavorable. Sandy soils are benefited by the addition of clayey soil, peat moss and other organic matter resulting from the use of Wizard Brand Cattle and Sheep Manures. Top soil to the depth of 4 inches should be broadcasted, as grass will not grow well in pure sand. The grasses used in our Seashore Mixture are adapted to unfavorable conditions, will quickly germinate in the top soil and make strong roots which will reach down into the sand for moisture. In order, however, to keep the seaside lawn in good condition it should be watered liberally each evening and also receive an occasional application of our sterilized Sheep Manure to maintain a supply of quickly available plant food. Sow 1 lb. to every 250 square feet.

In order to secure even distribution, divide the seed and broadcast one-half each way of the lawn, allowing 1 lb. to every 150 to 250 square feet.

HINTS ON LAWN PREPARATION AND IMPROVEMENT

Probably we receive more requests each season for help in lawn making and improvement than on any other subject connected with gardening, so we print the following information in hopes that it will answer many of them, though we recognize that practically every lawn presents an individual problem.

Nothing can replace thorough preparation—spading deeply to loosen the soil well—raking to free it from refuse of all kinds and to pulverize it finely—careful grading—enriching sufficiently, and seeding with ample amounts of good seed.

Deep spading improves the mechanical condition of the soil, permitting the tiny roots to penetrate deeply, and secure a maximum of soil food and water. It must be finely pulverized to make a good seed bed. Top soil (preferably a sandy loam) should be spread only on properly prepared sub-soil. Rake well to carefully grade, and always uphill on banks and terraces.

If the soil is known to be sour (acid), apply Land Lime to the rough grade and rake in before spreading either fertilizer or lawn seed. As insurance against the injurious grubs of June bugs and Japanese Beetles, dig in also 8 lbs. of Arsenate of Lead to each 1000 square feet. Broadcast at least 25 lbs. of good plant food like Bonemeal or 7-7-7 to each 1000 square feet, especially under trees.

When sowing your seed, be sure you broadcast it evenly. (A Cyclone Seeder will save seed, time and patience on large areas). Roll, if not sticky, with a water weight roller to settle the seed uniformly and make the lawn smoother and more presentable. On small spaces simply raking will answer. We advise watering at night or early morning—not when the sun shines. Cut the grass frequently with a sharp lawn mower after it first gets about 3 inches high.

The right kind of a lawn is luxuriant and thick and practically free from weeds. Where do weeds in the lawn come from? Only properly sterilized soil is entirely free from weeds seeds. Some may come with top-soil brought in, or from composts not thoroughly rotted, others are carried by the wind and birds, but more are sown each year in impure lawn seed. To secure a maximum of good seed we urge you to buy only Perry's high grade lawn mixtures. But when weeds do appear, dig them out promptly. Scatter in small amounts of additional seed where weeds have been extracted. Always keep a package of Lawn Seed on hand for this purpose.

The first work in the Spring on established lawns is the removal of all litter that has collected during the Winter. With the lawn clean, fill in all hollows with good top soil, and scatter fresh lawn seed and fertilize as for new lawns. Then while the ground is still soft, roll with a water-weight roller—one that can quickly be made heavy or light, at will, to meet conditions. The earlier this work can be done, the better. A rolled lawn will be smoother and have a neater appearance, though repeated rollings may be injurious.

PERRY'S PRIZE ASTERS

WILT-RESISTANT STRAINS. Wilt most commonly occurs in the hot Midsummer months just as the buds are beginning to open. The plant wilts, the leaves first turn yellow, then brown and curl, finally dying. The remedy is to use Wilt-resistant Strains that have proven so valuable that wherever available we offer them to the exclusion of other. Plants grown from Wilt-resistant Strains are not immune to the disease known as Aster "yellows," which is quite different and is transmitted by insects. However, they are not so susceptible to infection from it as they have a sturdier constitution. Varieties marked with asterisk (*) are Wilt-resistant.

HARDY LILIES

No garden is complete without Lilies. The fullest measure of decorative effect is secured when Lilies are used in combination with other plants and shrubs. Striking effects are produced by planting them among tall growing perennials, in front of large shrubs, or among dwarf shrubbery.

Good drainage is an essential point. The preparation of the soil should be such as to provide ample moisture during the growing period, but without having an excess of water during the dormant period. When planting the bulbs it is well to surround them with sand or fine gravel. This helps to drain away surplus moisture.

BIRD SUB-IRRIGATOR

Simplified Sub-Irrigation of Flats

Sub-irrigation is not a new idea. The Bird Sub-Irrigator is a simple and practical application of this principle which has been known for many years. The Bird Sub-Irrigator is a waterproof, fiber resin tray ½ of an inch deep, serving as a reservoir in the bottom of the flat. It is filled with crushed stone, screened gravel or cinders to allow free flow of water under the soil.

A small clay pot serves as a watering vent permitting water to flow into the drainage without directly wetting the soil. Capillary action draws the moisture slowly and evenly up into the soil as the seedlings or plants require it, thus helping to control damping off and insuring faster growth, better plants and higher yield.

Made to fit our regularly stocked greenhouse flat, 20x12x3 inches. 15c. each

CARBOLA with DDT

Carbola is primarily a powerful disinfectant that kills certain germs by contact which cannot be seen by the naked eye. This germ killer is combined with a snow-white pigment, same as used in all best oil paints. Thus, when Carbola is applied, it kills invisible germs by contact and dries white all in one easy operation. It can be sprayed or brushed on.

Carbola comes in powder form to which only cold water is needed to make a paint.

Carbola powder, just as it comes in the handy, clean packages, also makes an ideal dry disinfectant. The dry dusting method of disinfecting is considered very practical, especially for floors, dropping boards, nests in poultry houses, etc., where moisture is to be avoided.
